Create table

Table details

DynamoDB is a schemaless database that requires only a table name and a primary key when you create the table.

Table name
This will be used to identify your table.

user

Between 3 and 255 characters, containing only letters, numbers, underscores (`_`), hyphens (`-`), and periods (`.`).

Partition key
The partition key is part of the table's primary key. It is a hash value that is used to retrieve items from your table and allocate data across hosts for scalability and availability.

id

Number

1 to 255 characters and case sensitive.

Sort key - optional
You can use a sort key as the second part of a table's primary key. The sort key allows you to sort or search among all items sharing the same partition key.

Enter the sort key name

String

1 to 255 characters and case sensitive.

The screenshot displays the AWS Management Console's DynamoDB Tables page. At the top, a green banner indicates a successful deletion of the 'user' table. The main section, titled 'Tables (0)', shows no tables are currently present. A search bar and filters for 'Any tag key' and 'Any tag value' are visible. Below these, a horizontal menu lists various table attributes: Name, Status, Partition key, Sort key, Indexes, Replication Regions, Deletion protection, Favorite, Read capacity mode, and Write. A central illustration of a robot watering a plant is accompanied by the text 'You have no tables in this account in this AWS Region.' and a 'Create table' button. The left sidebar contains navigation links for Dashboard, Tables, Explore items, PartiQL editor, Backups, Exports to S3, Imports from S3, Integrations, Reserved capacity, and Settings. The bottom status bar shows the CloudShell interface with a temperature of 11°C and system icons.
